

Catalogue limits

what every downloadable image and table actually contains,
and the limit that follows from it

101 catalogue entries · 402 numeric limits · 1383 categorical fields

60 entries fed by the laboratory files, 51 by the .ixo vendor demonstrations, 70 by the .eds vendor demonstrations

8 entries reach nothing in the corpus: their limit is theoretical and their data set is invented inside it

Sample, run, target, operator and plate identifiers from the laboratory files are replaced by pseudonyms
before anything leaves the analysis. No laboratory identifier appears in this document or in the data sets beside it.

measured first, theoretical only where the corpus is silent

THE CORPUS

Six laboratory .ixc experiments, ten vendor demonstration .ixc experiments and eight vendor demonstration .eds experiments were loaded into the page itself, and every catalogue entry was asked for the rows behind it — the numbers the figure plots or the table hands out, not the picture.

SEPARATION BY INSTRUMENT FAMILY

Limits are derived separately for the .ixc family and the .eds family. Background fluorescence, passive reference level and timing are on different scales in the two, and a pooled limit would describe neither.

FROM MEASUREMENT

With twenty or more values: the median plus and minus three robust standard deviations ($1.4826 \times$ the median absolute deviation), widened to the first and ninety-ninth percentile, then clamped to what is physically possible for that quantity. With fewer than twenty values the observed range is given as it stands and the count is stated, because three runs cannot define a limit.

FROM SPECIFICATION

Where the chart definition carries a manufacturer figure for that instrument, that figure is the limit and the observed values are reported beside it.

INVENTED

Where no file in the corpus feeds an entry, the limit is the theoretical range for the quantity and twenty points are generated inside it. Those rows carry the word invented in an origin column, and the entries are listed on their own page.

PSEUDONYMS

852 distinct identifiers were replaced: 670 sample names, 72 run names, 26 targets, 18 plates and 4 operator names. Vendor demonstration names are replaced on the same rule, so no product name appears either.

What each source reaches

theoretical limit, data set generated inside it

ENTRY	LIMIT	BASIS
cc:ic_shift	5 .. 45 cycles	theoretical range for cycles
cc:roi_ms	0 .. 2000 ms	theoretical range for ms
img:ic	0 .. 100	theoretical range, generic
img:outcomes	0 .. 100	theoretical range, generic
img:repsd	0 .. 100	theoretical range, generic
img:x_control_age	0 .. 100	theoretical range, generic
img:x_control_batches	0 .. 100	theoretical range, generic
img:x_control_thermal	0 .. 100	theoretical range, generic

Twenty points were generated for each of these, evenly spaced over a year, normally distributed about the middle of the range and clipped to it. Every row carries an origin column saying so. They exist to exercise the chart, not to describe an instrument.

Fields that are not numbers

the values seen in the corpus define what is allowed
